## **Traffic Calming Devices**

Traffic calming is an art developed through trial and error which goal is principally to reduce traffic speeds and improve vehicular and pedestrian safety primarily along residential or local streets. Secondary impacts of traffic calming are a reduction in cut thru traffic. Traffic calming devices cause either vertical displacement i.e. Speed Humps; Raised Crosswalks; Platform Intersections or horizontal displacement i.e. Traffic Circles; Chicanes; Median Islands; Chokers.

In considering traffic calming for Wesley Avenue the narrow width eliminates consideration of horizontal displacement items. Both chicanes and medians islands would require right-of- way acquisition which would impact the residents on Wesley Avenue. Therefore vertical displacement methodology's are more appropriate. Of the options available speed humps are the logical option as there are no intersections or pedestrian crossing locations along the section of Wesley Avenue studied. It is my professional opinion that two speed humps would be adequate to reduce speeds

## **Recommendations**

It is recommended two speed humps be installed between Anderson Hill Road and the curve leading to Church Street. The first speed hump should be located in the vicinity of utility pole # NJ144BB, between 7-9 Wesley Avenue, and the second in the vicinity of utility pole # NJ 145 BB at 15 Wesley Avenue. The attached Figure 1 shows the recommended locations. These locations were selected to minimize impact to the residential frontages and driveways while still providing adequate spacing to impact traffic speeds. The final location is subject to a review and concurrence by the Police and Public Works Departments to insure no conflicts with manholes and other utilities.

Because of the Speed Limit of 15MPH I am recommending a 4" high by 10 ' wide speed hump. Which will provide maximum vertical displacement and effect vehicles traveling at 20 MPH or greater. That is not to say vehicles traveling below those speeds will not be impacted but their degree of discomfort will be more tolerable. A SPEED HUMP warning sign (MUTCD #W-17) with a 15 MPH Advisory Speed Plaque(MUTCD#W13-1P) should be installed at each speed hump for a total of 4 sign assemblies. The existing secondary 15 MPH Speed Limit signs should be removed as well as any other conflicting signage. In addition chevron type pavements markings should be placed on each Speed Hump. In constructing the Speed Humps they should not extend fully across the road in order to leave 6"-9" for gutter flow. The Speed Hump construction details and signing and striping details are shown on page 3.

## Scope of Study

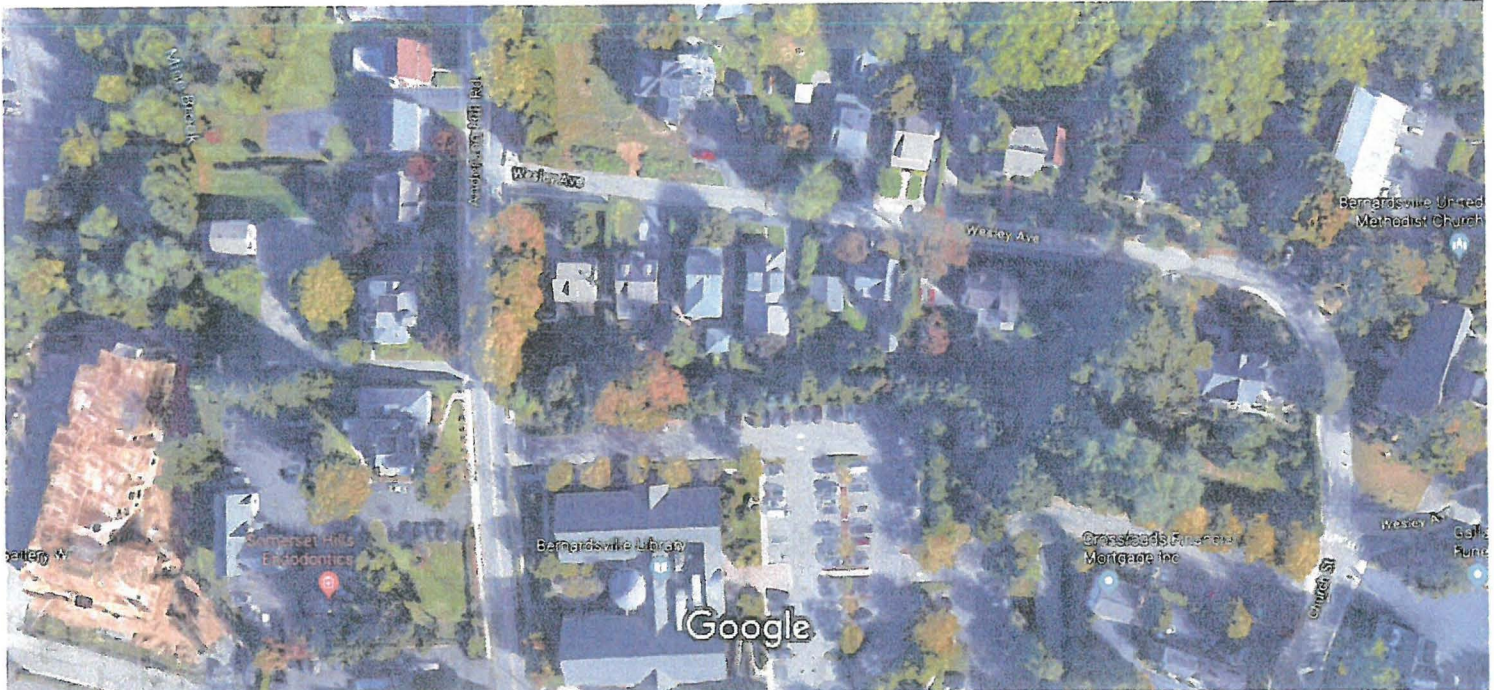

As a result of concerns of speeding, as expressed by residents, along Wesley Avenue a traffic calming investigation was authorized by the Borough. In conducting our study a field investigation was conducted of Wesley Avenue on July 11, 2019 at which time existing traffic control, street width and driveway locations were recorded. Observations were also made of traffic activity. Conversations regarding traffic concerns and traffic calming options were had with members of the Bernardsville Police and Public Works Departments. Traffic speed recordings conducted by the Bernardsville Police Department were reviewed and analyzed and a literature review of traffic calming devices and their effectiveness was conducted.

## Existing Conditions

The section of Wesley Avenue under study begins at Anderson Hill Road and extends northerly to a curve on Wesley Avenue where it meets Church Street. In this area Wesley Avenue is a two lane roadway measuring approximately 18-20 feet in width. For the most part there are no curbs or sidewalk along the street. The Speed Limit is posted at 15 MPH. Parking is not practiced along Wesley Avenue due to its narrow width although there are locations along the street where the edge of pavement has been extended to provide for on street parking.

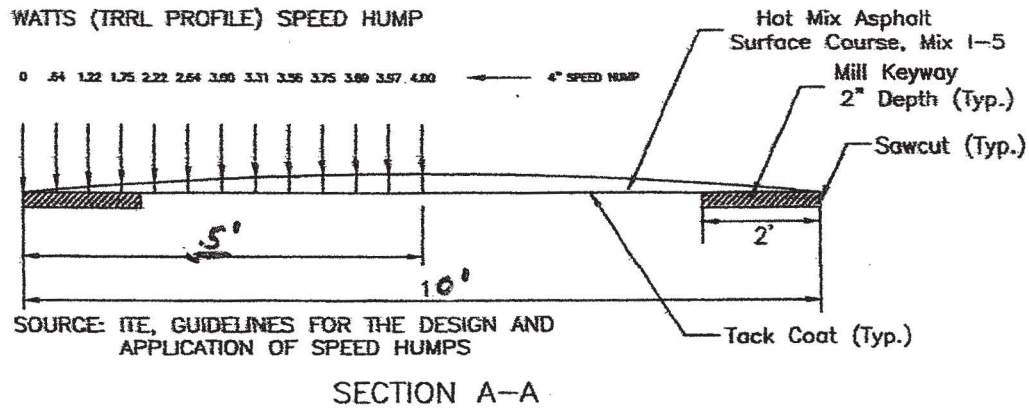

The speed data provided by the Police Department was gathered over a nine day period in January of 2019. The data shows an 85 percentile speed of 26 MPH with 14 percent of the vehicles traveling at 15 MPH or less and 59 percent exceeding 20 MPH. The highest speeds recorded were in the 41-45 MPH range and accounted for less than 0.05 percent.

# Proposed Speed Humps - Bernardsville Borough

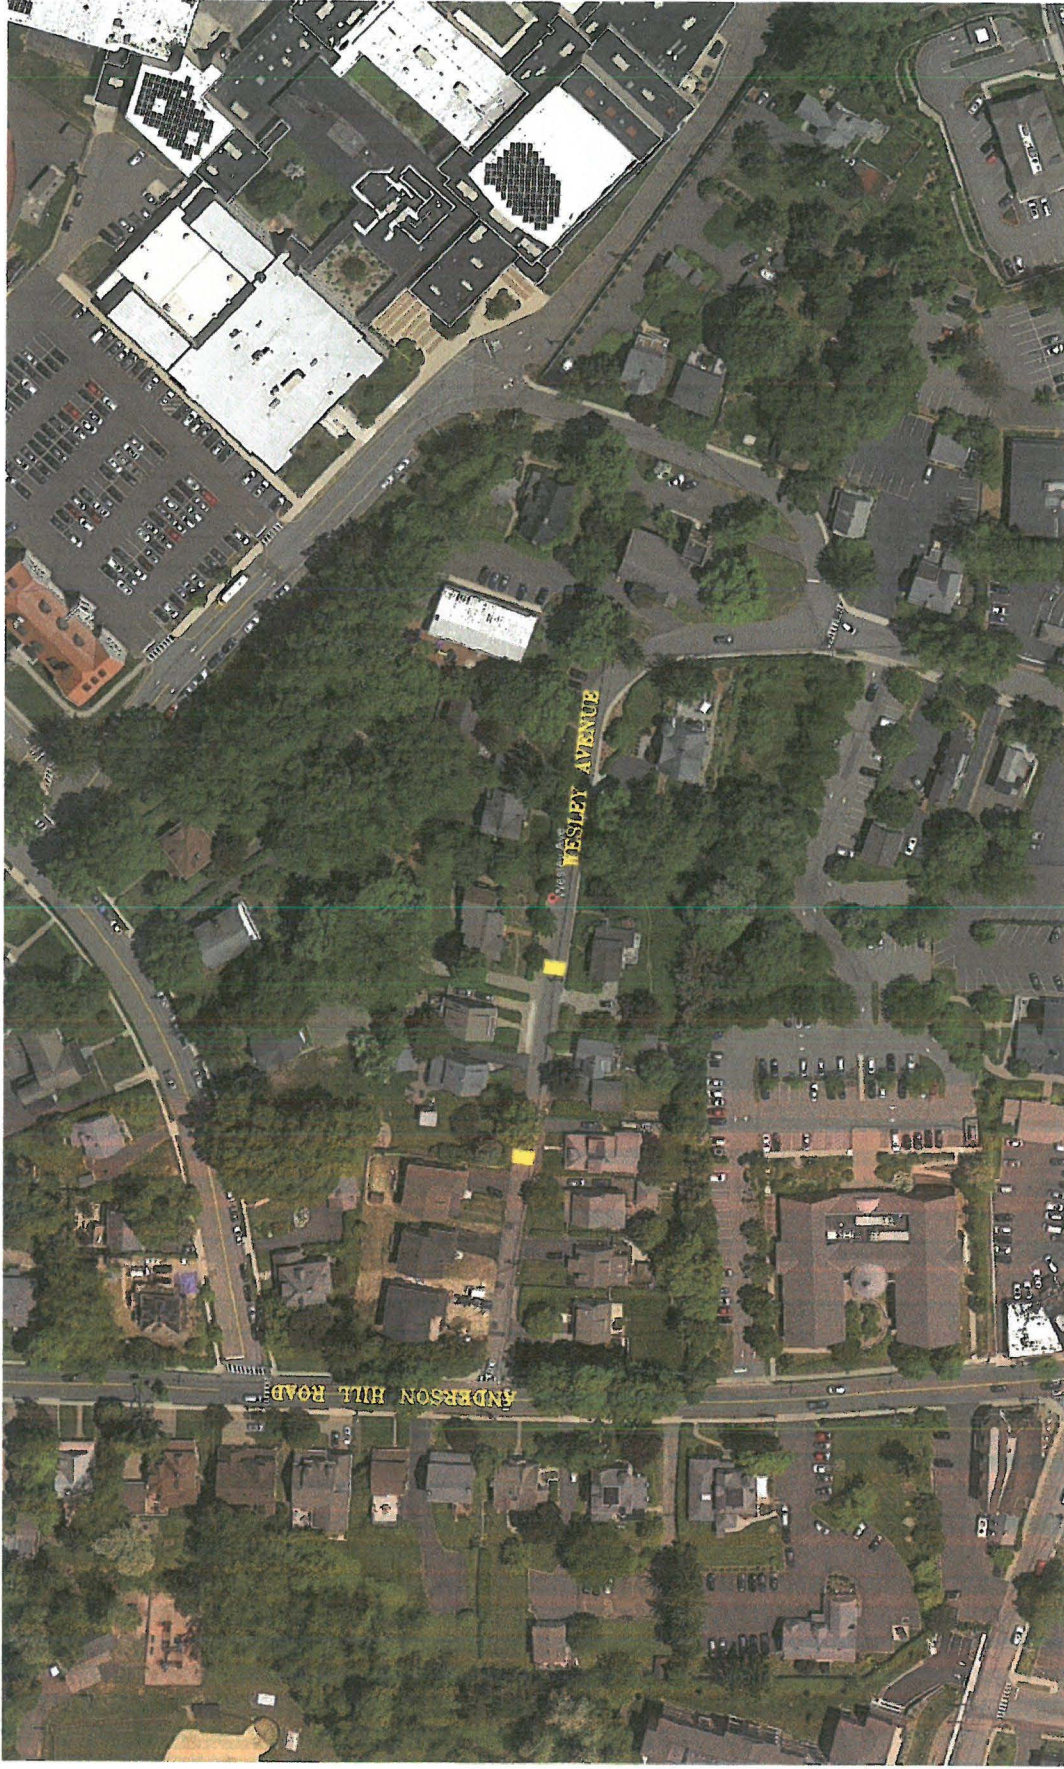

Figure 1  
Speed Hump Location Map

## **Wesley Avenue Speed Hump Q&A**

1) What would be the projected effect and benefit of the proposed speed humps on reducing speeding over 25 mph? Given prior experience with speed humps, what improvement in speed calming on Wesley Ave might we expect?

*Based on studies by the FHWA(Federal Highway Administration) speed humps have be shown to reduce 85th.percentile speeds by 6 to 13 % and crash reductions by 33 to 48%. Speed humps also reduce cut thru traffic although exact percentages are not available. thru FHWA. I would not expect as dramatic an 85th.-%-ile speed reduction but would expect the percentage of vehicles above 20 MPH to drop.*

2) The suggestion was to install a hump with a height of four inches. What's the range of heights that are available? Is 4" considered a speed table, hump or bump?

*Four inches is the maximum recommended height for speed humps and 10 feet the minimum length recommended. Three inches is the least I seen in literature and 20 feet the longest speed hump. The higher and shorter the speed hump the greater impact on speed reduction. I chose the least dimensions because of the posted speed limit of 15 MPH so we want the maximum effect. A speed hump has a parabolic shape, A speed table is flat and "ramps" up to its height. Speed tables are usually used at pedestrian crosswalks. Speed tables can range from 3 inches to 6 inches. The higher the table the longer the ramp. Finally speed bumps are usually 6" inches high and used in parking lots. Speed bumps are not acceptable on public streets as they present real hazards for police and emergency services.*

3) What is the noise generated by a typical sedan travelling at 25mph going over a speed hump?

4) What is the noise generated by a typical sedan travelling at 35mph going over a speed hump?

5) What is the noise generated by other vehicles that frequently drive on Wesley Avenue, school buses, garbage trucks, and landscaping vehicles with trailers?

Answers to Q3, Q4, and Q5 regarding noise:

*To date, there are 2 noise studies reviewing noise levels at rounded speed humps and flat speed tables. Speed humps and tables both reduce traffic noise levels by reducing speed 5dB(A) for tables 7 dB(A) for humps. The faster a vehicle moves the higher the tire noise. Rounded speed humps do a better job of reducing noise. When considering trucks(commercial vehicles) speed tables wider than 7' increase levels by about 7dB(A) while speed humps are still able to reduce noise by 1 dB(A).*

*Both articles cite potential increase in noise by nuisance drivers rapidly accelerating or breaking at humps or tables, and mention that on poorly maintained rounds humps and tables have little impact on noise reduction. These studies were conducted in Europe several years ago.*

*If there is any additional literature for recent studies and in the USA, they will be added to this Q&A.*

6) Is there any leeway in the proposed placement of speed humps so they are not directly outside a resident's windows?

*The speed humps can be shifted couple of guidelines check for manholes, try and keep northerly one at least 75' from curve and at least 125' apart.*

### **Additional Info on Speed Hump Noise**

1. Speed humps reduce noise along a roadway but may increase sound at the "hump" itself due to: braking; accelerating; traveling too fast.
2. For trucks, noise may increase at humps greater than passenger vehicles due to: noisier than cars in decelerating and accelerating; stiffer suspension; traveling too fast
3. Trailers may be noisier due to type of load (lawn mowers) and suspension

The previously answered figures regarding reduction and increase in noise due to speed humps are valid. The following table quantifies noise levels:

NOISE GENERATOR	NOISE LEVEL
Rock Music near stage	110 db(A)
Heavy Truck slow moving 35' from road	70 db(A)
Car @ 40MPH 35' from road	70 db(A)
Normal conversation 3'	60 db(A)
Quiet Conversation 3'	50 db(A)

A 10 db(A) increase is a doubling of noise
